FARM WAGE RATES CONTINUE DOWN

Farm wages on October 1 continued their decline from last year at a slightly sharper rate than shown in previous quarters this year, the Bureau of Agricultural Economics reported today. The average of all wage rates, converted to an hourly basis, for the entire country was 59 cents this October compared to 62 cents a year ago, a decrease of 5 percent.

The number of persons at work on farms totaled 12,913,000 for the week of September 18-24. Farm employment was up 11 percent from a month earlier. The number of family workers increased about as usual while hired employment was up slightly in contrast to the usual small decline. Family employment and hired employment were each less than in September a year ago.

All types of farm wage rates for the United States on October 1 were less than a year earlier except per week without board or room. The decrease was largest for hourly rates without board and room, which are the time rates most commonly used for short-time seasonal jobs, except in the South. The wage rates of short-time seasonal workers are usually the first affected by increases in the supply of people looking for farm work.

The average of all wage rates decreased from last October in all regions except the West South Central. There was no change in this region. The largest percentage decrease, 11 percent, occurred in the East South Central States, but declines ranged from 6 to 9 percent in all other regions except the South Atlantic where it was 4 percent.

The seasonal increase in the overall average of all wage rates from July to October was only about half as much as a year ago. In regions with customary seasonal increases, the increases were less than usual while in the areas in which wage rates drop from July to October there were larger than usual declines. The increase in the South Atlantic States was the same as a year ago.

The seasonal increase in the number of family workers employed on farms was largest in the South Central regions. Family employment in late September was about 50 percent larger than a month earlier. This is about the usual increase that comes with the peak of cotton picking. In the South Atlantic and Pacific regions, family employment increased slightly, about the usual amount in the South Atlantic and a little more than average in the Pacific. In other

regions the number of family workers declined slightly as usual. In comparison with a year ago, family employment was about the same or down slightly for all regions.

The increase over a month ago in hired workers was due largely to greater than usual seasonal increases in the South Central regions, especially the East South Central group. Hired employment in these regions increased by a little more than a third. The number of hired workers increased seasonally by 15 percent in the East North Central States. The 5 percent increase in the Pacific States differed from the usual "no change." Hired farm employment was up from last year in the New England, East North Central, East South Central and Mountain Regions, but not enough to offset declines in other areas.

Rains delayed farm work on several days during the week of September 18-24 in the Northeast, Middle Atlantic, the far Southeast, and along the Gulf Coast. The additional moisture, however, was needed in most of these areas. Elsewhere generally fair weather, with warm days, cool nights, much sunshine, and low relative humidity, favored the maturity of most crops and was ideal for outside work. The chief complaint was the need of additional moisture to aid in preparation of the soil and to favor seeding and germination of small grains.

In the East and Northeast late fruit and truck crop harvests continued. The soybean harvest was under way in most areas. Cotton picking required large numbers of laborers throughout the South and the corn harvest had started in most areas. The peanut harvest was well along in the South as was potato digging in the North. Sugar beet lifting had begun in a few areas, and was about ready to start in other producing areas. Many farmers were busy preparing land and seeding it to fall grains or legumes.

Farm work in New England during the week of September 18-24, particularly potato harvesting, was delayed by rains. Fall planting operations proceeded as the weather permitted. It was generally a frost free period in the area. The apple crop was about harvested except in the northern areas.

In the Middle Atlantic States in late September farmers were busy preparing land and planting small grains and other fall crops. Potato digging and apple picking were major activities in many parts of the area. Most of the Long Island early potato crop had been dug and late varieties were being harvested. In the commercial truck crop section of Southern New Jersey, the harvest of fall crops was beginning. Harvest of tobacco, corn, apples, and potatoes in Pennsylvania continued when the weather permitted.

Harvesting soybeans and seeding winter wheat were major farm tasks in many parts of the East North Central States during the week ended September 24. Farm workers were also harvesting late truck crops and picking apples and other fruits. Preparations were being made to pick a large corn crop. Sugar beet lifting in parts of Ohio and Michigan required considerable hired labor.

The season's haying operations were being completed in the West North Central States during the survey week. Potato and sugar beet harvests were progressing at a rapid rate in North Dakota and Minnesota. Fall plowing and seeding of winter crops were also major activities over much of the southern part of the area.

Cotton picking continued in the South Atlantic States while the tobacco harvest was nearly finished. In North Carolina much farm labor continued to be used for grading and marketing tobacco. The harvesting of peanuts had begun and digging of sweetpotatoes was quite general. In Maryland, Virginia, and West Virginia the harvest of the commercial apple crop was in full swing. Corn harvesting and fall seeding were also activities requiring considerable farm labor.

By the last of September, cotton picking was active throughout the East South Central States. It was about completed in the southern portion of Alabama and Mississippi. Farmers were also busy preparing ground and planting winter small grains. Burley tobacco was being stripped and graded in both middle and eastern Tennessee. The digging of peanuts in Alabama had passed the halfway mark and threshing had begun.

Cotton picking was the major farm activity in the West South Central States. The rice harvest was well along in this area. In Oklahoma and Texas farmers were preparing land and seeding small grains. Harvesting of peanuts had begun in most sections. The grain sorghum harvest in Texas was nearly completed except on the high plains. Field work was active in the south Texas commercial truck crop area.

Dry bean harvest was in progress over nearly all of the Mountain States. Cotton picking in southern parts of New Mexico and Arizona was furnishing work for large numbers of hired hands. In northeastern New Mexico and southeastern Colorado broom corn harvest was well along. Potato digging was under way in Idaho, Montana, and Wyoming. Sugar beet harvest had begun in a few areas.

In the Pacific States harvest of late potatoes and walnuts was beginning. Apple picking was a major farm activity in eastern Washington. Preparation of land for small grain was going on in all parts of Oregon while the harvest of most vegetables and fruits in the State was nearly finished. Cotton picking and the harvest of tomatoes, sugar beets, beans, rice, grapes, walnuts, and potatoes caused an increase in labor needs in California.

Bureau of Agricultural Economics

DEFINITIONS AND EXPLANATIONS

Employment

Farm employment estimates of the Bureau of Agricultural Economics cover persons doing farm work on all farms. Mailed questionnaires are received every month from 15,000 to 20,000 farmers who report the number of persons working on their farms. Interview surveys of farmers are used less frequently to provide bench mark data on employment. The survey week for the mailed questionnaire each month is the last complete calendar week in the month except when that week includes the last day of the month; in that case the survey week is the next to the last full calendar week.

Employment concepts

All farm operators are counted as employed if they spend one hour or more during the survey week at farm work, chores, or in the transaction of farm business. Members of the operator's family or household doing unpaid farm work, or chores, are counted if they put in 15 hours or more during the survey week. Operators plus unpaid members of their families or households who meet these criteria of employment are called family workers. All persons doing one or more hours of farm work or chores for pay during the survey week are counted as hired workers. Members of the operator's family doing farm work for cash wages are counted as hired workers. Croppers are considered family workers when working on their own crops, but hired workers when doing farm work for pay off their own tracts. If a person is employed both as a family worker and a hired worker during the week on the same farm he is counted as a hired worker.

Comparability with other data

The data on farm employment published by the Bureau of Agricultural Economics differ from those on agricultural employment published by the Bureau of the Census in the Monthly Report on the Labor Force. The Bureau of Agricultural Economics collects information from the employer (the farmer) who reports the number of persons working on his farm during the week, regardless of the other jobs held by those workers. The Census data, on the other hand, are obtained through interviews with approximately 25,000 farm and nonfarm households with the housewife or some other member of the household reporting on the labor force status of the household members. They relate only to persons 14 years of age and over who are in the civilian population and not in institutions.

The difference between the BAE and the Census data is attributable mainly to the different treatment of three groups of workers. Children under 14 years of age who meet the criteria of employment are included

in the BAE estimates, but not in the Census Bureau's. It is estimated that this number may reach a summer peak as high as two million. Persons working on more than one farm during the survey week are counted only once by the Census Bureau, but they are counted by the BAE on each farm where they work and meet the minimum hour requirements. This group is also more numerous during the harvest season when the demand for farm labor is greatest. The additional count of workers attributable to this duplication is estimated at a minimum of a quarter of a million and may be considerably larger. The third group is composed of persons who work in both agricultural and nonagricultural employment, but work longer at the nonagricultural job; they are classified by Census as working in nonagricultural employment, but by the BAE as working on a farm. This last group may range from one-half million to a million in different seasons of the year.

Other groups counted by the BAE but not by the Census Bureau are imported foreign workers and some migratory workers not living in private households. On the other hand, the Census Bureau includes in its estimates of agricultural employment certain classes of workers which the BAE does not include. Persons with "nonfarm" occupations who are working on farms, such as bookkeepers and typists, some persons in certain agricultural processing activities, and farm operators with no other job who did no farm work are considered as employed in agriculture by the Census Bureau, but are not included by the BAE in its estimates of agricultural employment.

Because the volume of agricultural employment is affected by changes both in season and in weather, the difference in the week of the month for which the data are collected may also make some difference. The BAE data relate to the last full calendar week ending at least one day before the end of the month while the Census Bureau Information relates to the week containing the 8th of the month.

The BAE estimates farm employment from current reports made by a selected group of farmers adjusted to enumerative survey bench mark data. The Bureau of the Census bases its figures on a sample of dwelling units. Accordingly, the figures in both cases are subject to a sampling variation and may differ from the results of a complete census.

Wage rates

Wage rates are reported quarterly by the same sample of farm operators that reports employment. The farmer is asked to report average wage rates being paid "at this time" in his locality. The "at this time" on the average probably represents the second or third day before the end of the month.
